Product Requirements Specification

WREI Enterprise Deployment: Downer Use Case

Prepared by: Sarah Taylor, CBS Group Pty Ltd **Date:** April 2026 **Target Audience:** WREI Product & Development Team

---

1. Product Vision and Context

The current WREI platform is designed for environmental certificate brokers (e.g., Northmore Gordon). The broker use case focuses on trading execution, market intelligence, and client procurement.

This specification defines a new enterprise deployment model designed for **infrastructure and services operators** (specifically, Downer Group). Unlike brokers, operators need to identify and originate certificate opportunities across their own divisions and client base before any trading occurs.

The Downer deployment requires retaining specific broker modules (intelligence, compliance tracking) while building a new **Origination & Diagnostic Layer** that sits at the front of the user journey.

2. Core User Personas

1. **Business Development (BD) Manager:** Needs to quickly assess whether a prospective client project (e.g., a facility HVAC upgrade) has ESC/VEEC potential, and generate a branded opportunity assessment to include in the pitch.
2. **Division General Manager:** Needs visibility of the total certificate pipeline and compliance exposure within their division.
3. **Central Compliance/Sustainability Lead:** Needs an aggregated view of all certificate assets, liabilities, and regulatory deadlines across the entire Downer group.

3. Module Requirements

3.1 New Module: Pre-Validation Diagnostic Engine

Purpose: A guided workflow to assess the eligibility and estimated value of a potential energy efficiency project.

Functional Requirements:

- **Jurisdiction & Scheme Routing:** User selects project location (NSW/VIC) to route to ESS or VEU rule sets.
- **Asset & Activity Classification:** Dropdown selection of asset types (e.g., Commercial Lighting, HVAC, Motors) mapped to current scheme methodologies.
- **Eligibility Gate:** Hard stops for known disqualifiers (e.g., asset age, previous upgrades, ineligible facility types).
- **Yield Estimator:** Basic calculator requiring minimal inputs (e.g., current MWh vs. proposed MWh, or standard equipment replacement counts) to generate a rough certificate yield estimate.
- **Output Generation:** Must generate a downloadable, Downer-branded PDF *Certificate Opportunity Assessment* showing the estimated yield, applicable method, and estimated financial value (using the current WREI price forecast).

3.2 New Module: Energy Cost Attribution Tool

Purpose: To resolve the "who is the energy saver?" question, which is the primary legal blocker for project origination.

Functional Requirements:

- **Stakeholder Mapping:** UI to define the Asset Owner, Facility Operator, and Tenant.
- **Cost Responsibility Logic:** A decision tree that asks who pays the electricity bill, who holds the retail contract, and whether costs are passed through.
- **Nomination Readiness Assessment:** Based on the inputs, the tool must identify the legally eligible "energy saver" and flag whether a split-incentive issue exists that requires contractual resolution before a Nomination Form can be signed.

3.3 New Module: Enterprise Project Pipeline

Purpose: A CRM-style Kanban board for tracking certificate opportunities from diagnostic to registration.

Functional Requirements:

- **Stages:** Diagnostic → Validation → Implementation → M&V/Audit → Registration → Sale.
- **Aggregation:** Must roll up the estimated financial value of all projects in the pipeline, applying probability weightings based on the stage.
- **Filtering:** Ability to filter the pipeline by Downer division, client, scheme (ESS/VEEC), and status.

3.4 Adapted Module: Client Portfolio & Compliance Tracking

Purpose: Adapted from the broker version to serve Downer's internal divisions and external obligated clients.

Functional Requirements:

- **Entity Hierarchy:** Must support a parent/child structure (e.g., Downer Group -> Downer Rail -> Specific Fleet).
- **Exposure Dashboard:** Must calculate and display penalty exposure (Shortfall × IPART/ESC penalty rate) with a countdown to the surrender deadline.

3.5 Retained Module: Price Intelligence & Forecasting

Purpose: The core WREI forecasting capability, exposed to Downer users to inform project timing and valuation.

Functional Requirements:

- **Unchanged from Broker Version:** 26-week forecast, Buy/Hold/Sell signals, supply/demand metrics.
- **Integration:** The current spot price and 26-week forecast must feed directly into the Yield Estimator (Module 3.1) to provide dynamic financial valuations in the Opportunity Assessments.

4. Excluded Modules (Do Not Deploy)

The following modules from the standard WREI broker platform are **not required** for the Downer deployment:

- AI Correspondence Engine (RFQ drafting)
- AI-Assisted Negotiation Agent (Bilateral trading)
- Broker-specific settlement workflows

5. Non-Functional Requirements

- **White-Labeling:** The platform must be fully configurable with Downer's brand assets (logo, primary/secondary colours, typography) across all UI elements and generated PDFs.
- **Authentication:** Must support SSO integration (SAML/OIDC) with Downer's enterprise active directory.
- **Data Segregation:** Strict tenant isolation; Downer's pipeline and client data must be cryptographically separated from any broker or other enterprise deployments on the WREI infrastructure.
